

EE382V (17325): Principles in Computer Architecture
Parallelism and Locality
Fall 2007

Lecture 20 – Programming the Cell BE

Mattan Erez

The University of Texas at Austin

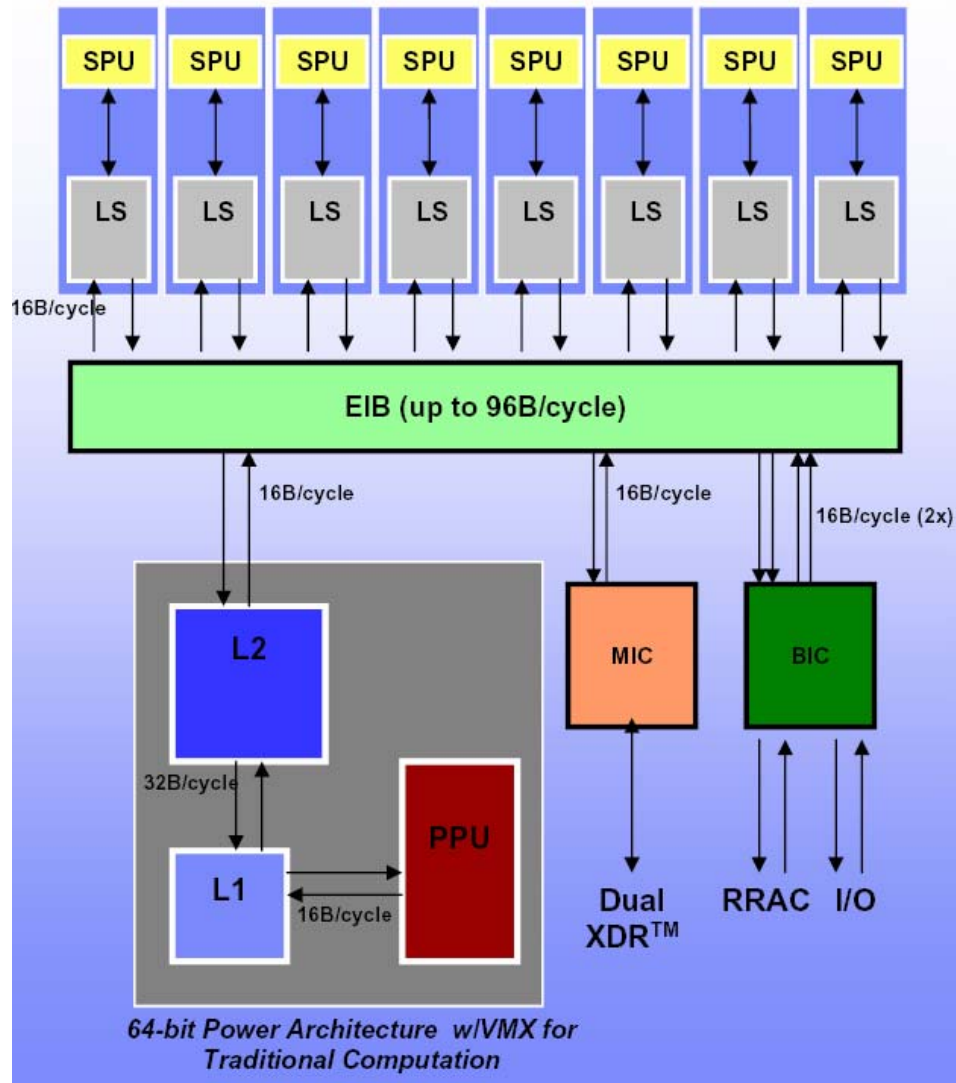

Outline

- Cell mechanism review
- Cell programming challenges
- Sequoia
 - (up to mapping in this lecture)
- Other Cell programming tools
 - Next lecture

- Sequoia part courtesy Kayvon Fatahalian, Stanford

- All Cell related images and figures © Sony and IBM
- Cell Broadband Engine TM Sony Corp.

Minimalistic HW structures improve performance and efficiency

from: "Unleashing the power: A programming example of large FFTs on Cell" given by Alex Chow at power.org on 6/9/2005

Parallelism in Cell

- PPE has SIMD VMX instructions and is 2-way SMT
- 8 SPEs
 - Each SPE operates exclusively on 4-vectors
 - Odd/even instruction pipes
 - Odd for branching and memory / Even for compute
 - Pipelining for taking advantage of ILP
- Asynchronous DMAs
 - SWP of communication and computation
 - Memory-level parallelism

Locality in Cell

- PPE has L1 and L2 caches
 - L2 cache is 512KB
- SPE have lots of registers and local store
 - 128 registers per SPU
 - 256KB LS per SPU

Communication and Synchronization in Cell

- Element Interconnect Bus (EIB)
 - Carries all data between memory system and PPE/SPEs
 - Carries all data between SPE→SPE, SPE→PPE, and PPE→SPE
- PPE L2 cache is coherent with memory
- SPEs are not coherent (LS is not a cache)
 - SPE DMA coherent with L2
- SPEs can DMA to/from one another
 - Memory map LS space into global namespace
 - Each SPE has local virtual memory translation to do this
 - No automatic coherency – explicit synchronization
- Synchronization through memory or mailboxes

Outline

- Cell mechanism review
 - **Cell programming challenges**
 - Sequoia
 - Other Cell programming tools

Cell Software Challenges

- Separate code for PPE and SPEs
 - Explicit synchronization
- SPEs can only access memory through DMAs
 - DMA is asynchronous, but prep instructions are part of SPE code
 - SW responsible for consistency and coherency
 - SW responsible for alignment, granularity, and bank conflicts
- SPEs must be programmed with SIMD
 - Alignment is up to SW
 - Lots of pipeline challenges left up to programmer / compiler
 - Deep pipeline with no branch predictor
 - 2-wide scalar pipeline needs static scheduling
 - LS shared by DMA, instruction fetch, and SIMD LD/ST
 - No memory protection on LS (Stack can “eat” data or code)

Separate Code for PPE and SPEs

- PPE should be doing top-level control and I/O only
 - Trying to compute on the PPE is problematic
 - In order 2-way SMT with deep pipeline
 - Busy enough just trying to coordinate between the SPEs
- SPEs are the parallel compute engines
 - PowerPC architecture, but really different ISA and requirements
 - Vector only, 2-way superscalar, ...
- Two processor types really have two different software systems
- Synchronization can be tricky to get efficient
 - PPE → SPE should use mailbox
 - SPE → PPE should use L2 cache location
 - Why?
- Spawning threads on SPEs painfully slow

Memory System Challenges

- No arbitrary global LD/ST from SPE
 - Everything must go through DMA
- Strict DMA alignment and granularity restrictions
 - All DMAs **must** be aligned to 16-bytes and request at least 16 bytes
 - All DMAs *should* be aligned to 128-bytes and request at least 128 bytes of contiguous memory
 - **Failing to maintain alignment will cause a bus error!**
- Banked DRAM structure
 - Consecutive DMA requests should span 2KB (8 banks)
- DMA commands issued from within SPE
 - Strided data access
 - Chain of stride commands to have arbitrary gather
 - Chained list of commands prepared by SPE and stored in LS
- Need to explicitly synchronize with DMA completion

SPE Programming Challenges

- Vector only
 - Scalars must be placed in LSW of vector and some instructions will take this into account
 - All casts and operations are aligned to 16 bytes (4 words)
 - Poor integer → float casting
- LS is only SRAM in SPE
 - Careful with growing stack
 - Sometimes need to force instruction prefetch to avoid stalls
 - Priority given to DMA first, then LD/ST, and only then fetch
- No branch prediction (predict not-taken?)
 - Can have branch hint instructions inserted explicitly
- Some help from XLC compiler (and an occasional bug)

Overall

- Lots to deal with
 - Explicit communication and synchronization
 - Explicit locality
 - Explicit parallelism
 - Explicit pipeline scheduling
-
- Need some help from programming tools

Outline

- Cell mechanism review

Sequoia

- Language: stream programming for machines with deep memory hierarchies
- Idea: Expose abstract memory hierarchy to programmer
- Implementation: benchmarks run well on Cell processor based systems and on cluster of PCs

Key challenge in high performance programming is:

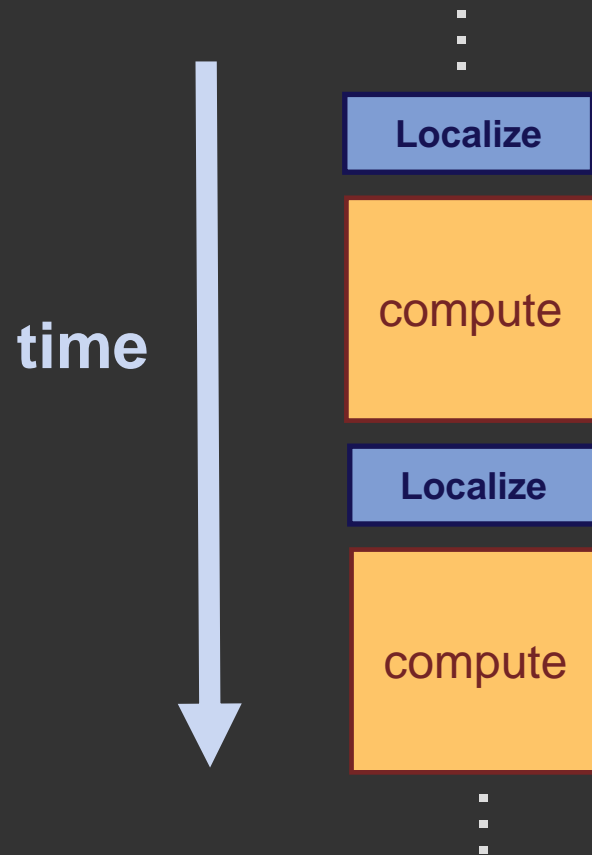

communication (not parallelism)

Latency

Bandwidth

Avoiding latency stalls

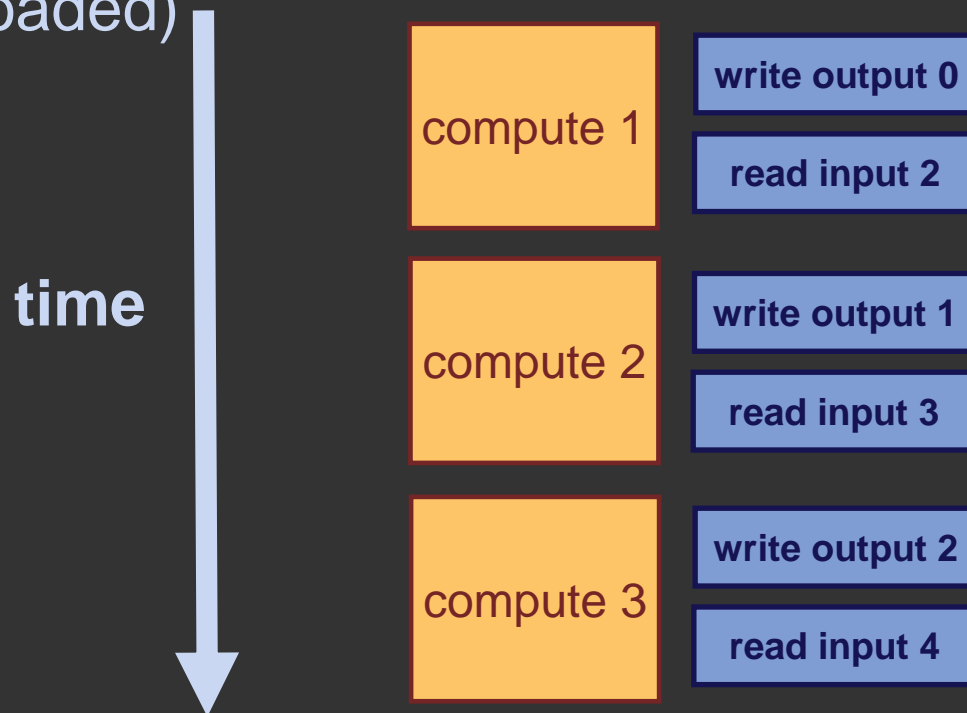

- Exploit locality to minimize number of stalls
 - Example: Blocking / tiling

Avoiding latency stalls

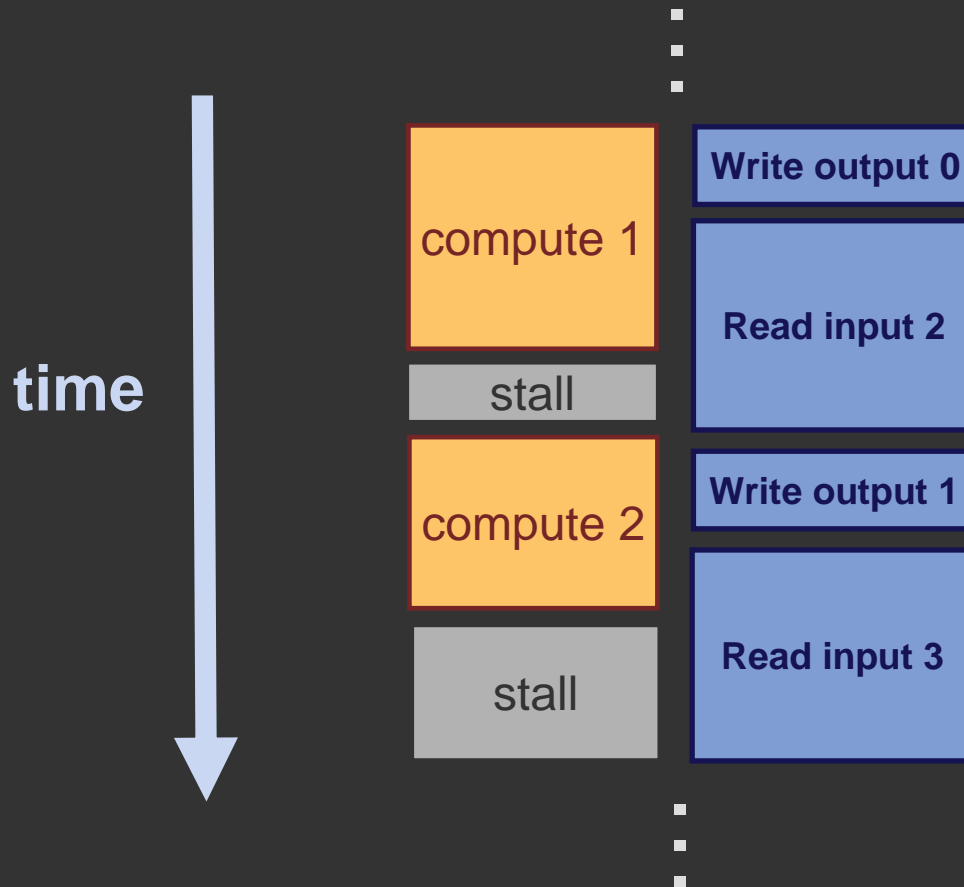

1. Prefetch batch of data
2. Compute on data (avoiding stalls)
3. Initiate write of results

... Then compute on next batch (which should be loaded)

Exploit locality

- Compute > bandwidth, else execution stalls

Streaming

Streaming involves structuring algorithms as collections of independent [locality cognizant] computations with well-defined working sets.

This structuring may be done at any scale.

- Keep temporaries in registers
- Cache/scratchpad blocking
- Message passing on a cluster
- Out-of-core algorithms

Streaming

Streaming involves structuring algorithms as collections of independent [locality cognizant] computations with well-defined working sets.

Efficient programs exhibit this structure at many scales.

Locality in programming languages

- Local (private) vs. global (remote) addresses
 - UPC, Titanium
- Domain distributions (map array elements to location)
 - HPF, UPC, ZPL
 - Adopted by DARPA HPCS: X10, Fortress, Chapel

Focus on communication between nodes
Ignore hierarchy within a node

Locality in programming languages

- Streams and kernels
 - Stream data off chip. Kernel data on chip.
 - StreamC/KernelC, Brook
 - GPU shading (Cg, HLSL)
 - CUDA

Architecture specific
Only represent two levels

Hierarchy-aware models

- Cache obliviousness (recursion)
- Space-limited procedures (Alpern et al.)

Programming methodologies, not
programming environments

Sequoia's goals

- Facilitate development of hierarchy-aware stream programs ...
 - ... that remain portable across machines
- Provide constructs that can be implemented efficiently **without requiring advanced compiler technology**
 - Place computation and data in machine
 - Explicit parallelism and communication
 - Large bulk transfers

Hierarchical memory in Sequoia

Hierarchical memory

- Abstract machines as trees of memories

Dual-core PC

Similar to:

Parallel Memory Hierarchy Model
(Alpern et al.)

Hierarchical memory

- Abstract machines as trees of memories

Dual-core PC

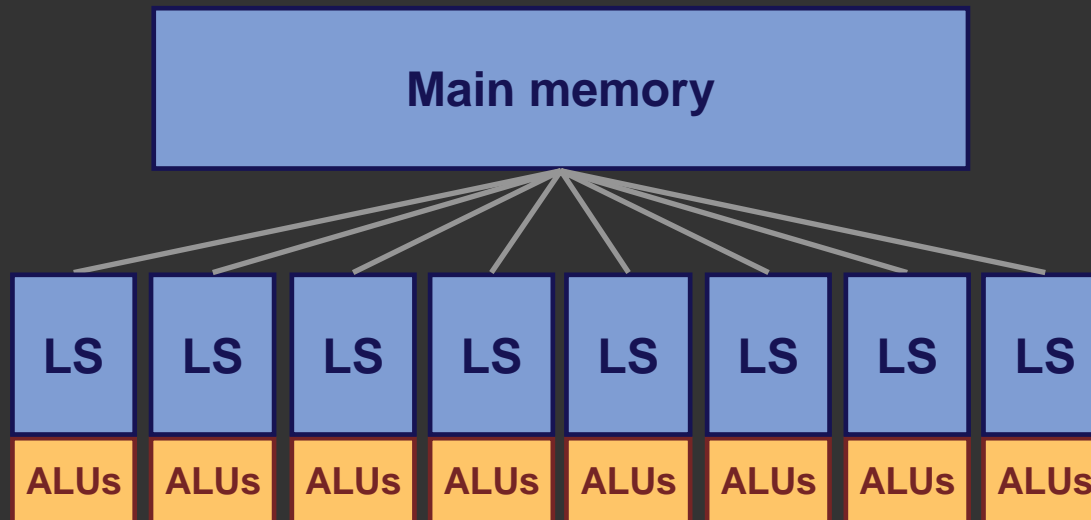

4 node cluster of PCs

Hierarchical memory

Single Cell blade

Hierarchical memory

Single Cell blade

Hierarchical memory

Dual Cell blade

(No memory affinity modeled)

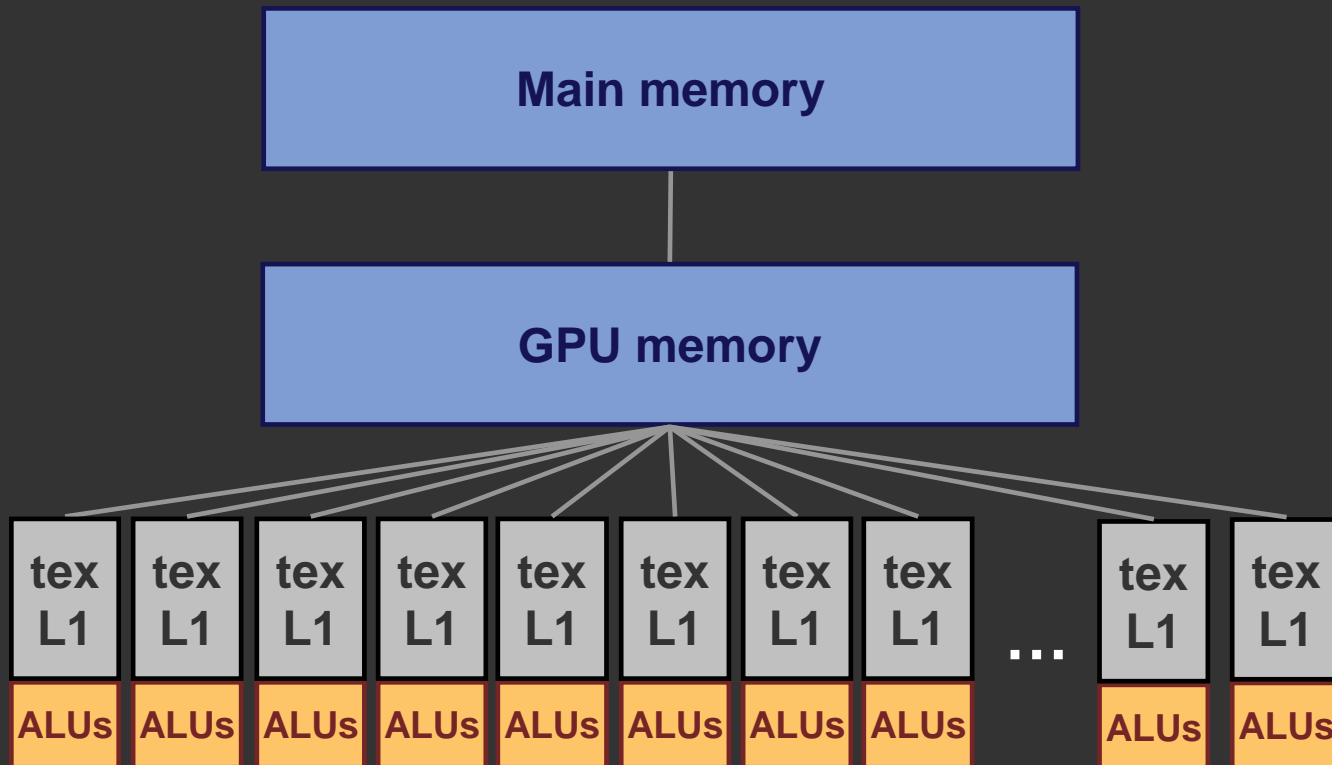

Hierarchical memory

Cluster of dual Cell blades

Hierarchical memory

System with a GPU

Blocked matrix multiplication

$$C += A \times B$$

```
void matmul_L1( int M, int N, int T,  
               float* A,  
               float* B,  
               float* C)  
{  
    for (int i=0; i<M; i++)  
        for (int j=0; j<N; j++)  
            for (int k=0; k<T; k++)  
                C[i][j] += A[i][k] * B[k][j];  
}
```

matmul_L1
32x32
matrix mult

Blocked matrix multiplication

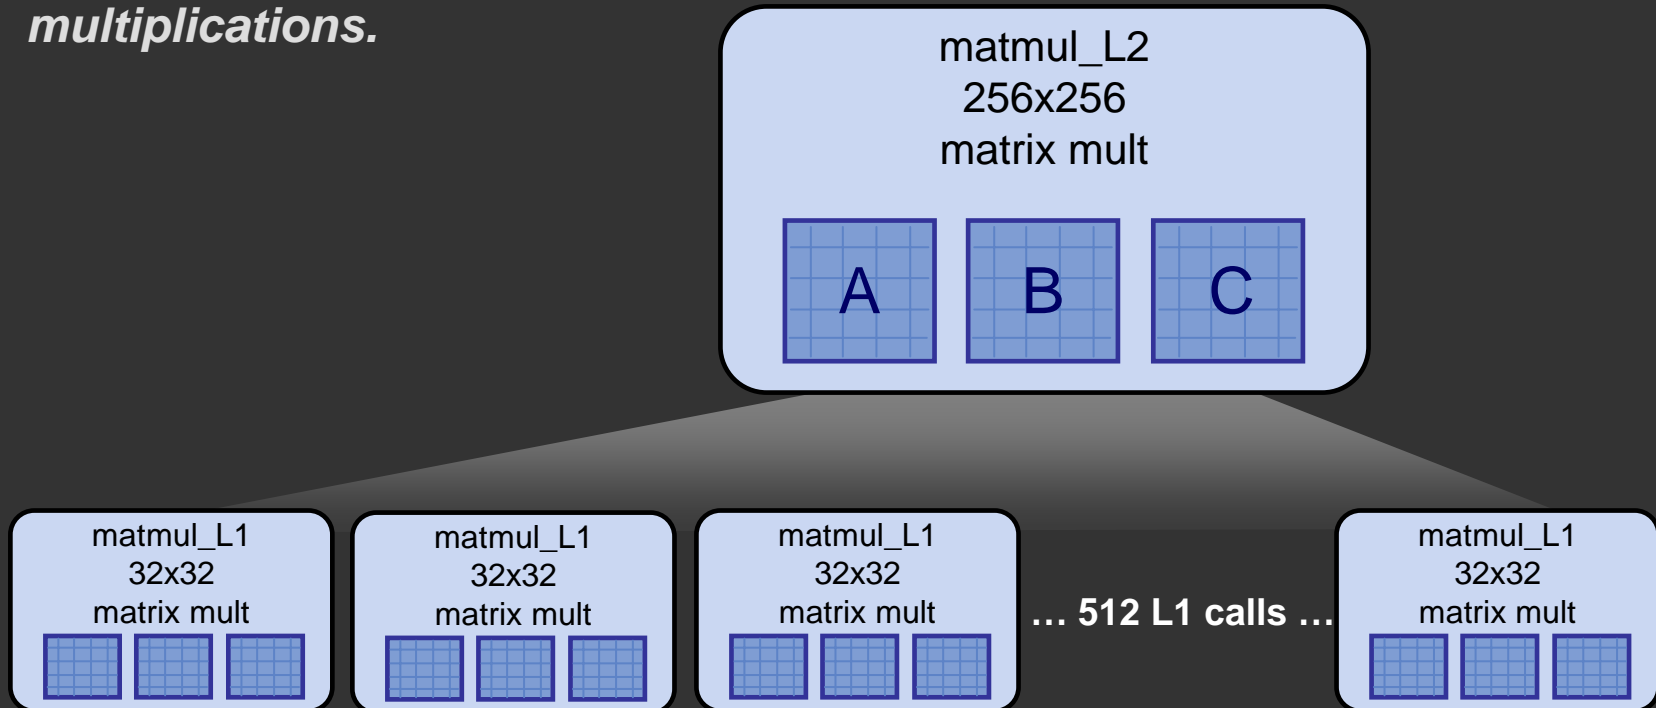

$$C += A \times B$$

```
void matmul_L2( int M, int N, int T,  
               float* A,  
               float* B,  
               float* C)
```

```
{
```

Perform series of L1 matrix multiplications.

```
}
```

Blocked matrix multiplication

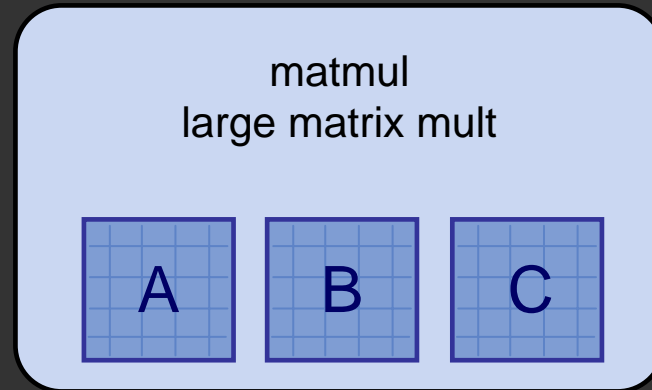

$$C += A \times B$$

```
void matmul( int M, int N, int T,  
            float* A,  
            float* B,  
            float* C)
```

```
{
```

Perform series of L2 matrix multiplications.

```
}
```

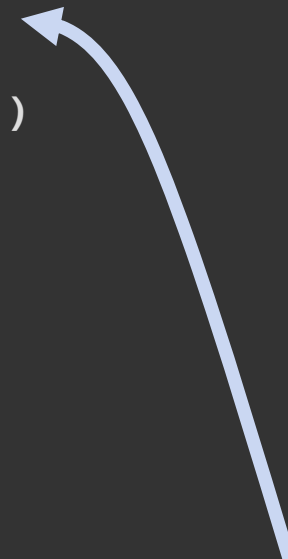

Sequoia tasks

Sequoia tasks

- Special functions called **tasks** are the building blocks of Sequoia programs

```
task matmul::leaf( in    float A[M][T],
                  in    float B[T][N],
                  inout float C[M][N] )
{
    for (int i=0; i<M; i++)
        for (int j=0; j<N; j++)
            for (int k=0; k<T; k++)
                C[i][j] += A[i][k] * B[k][j];
}
```

Read-only parameters M, N, T give sizes of multidimensional arrays when task is called.

Sequoia tasks

- Task arguments and temporaries define a working set
- **Task working set resident at single location in abstract machine tree**

```
task matmul::leaf( in    float A[M][T],  
                  in    float B[T][N],  
                  inout float C[M][N] )  
{  
    for (int i=0; i<M; i++)  
        for (int j=0; j<N; j++)  
            for (int k=0; k<T; k++)  
                C[i][j] += A[i][k] * B[k][j];  
}
```

Task hierarchies

```
task matmul::inner( in    float A[M][T],
                   in    float B[T][N],
                   inout float C[M][N] )
```

```
{
    tunable int P, Q, R;
```

Recursively call matmul task on submatrices of A, B, and C of size $P \times Q$, $Q \times R$, and $P \times R$.

```
}
```

```
task matmul::leaf( in    float A[M][T],
                  in    float B[T][N],
                  inout float C[M][N] )
```

```
{
    for (int i=0; i<M; i++)
        for (int j=0; j<N; j++)
            for (int k=0; k<T; k++)
                C[i][j] += A[i][k] * B[k][j];
```

```
}
```

Task hierarchies

```
task matmul::inner( in    float A[M][T],
                   in    float B[T][N],
                   inout float C[M][N] )
{
  tunable int P, Q, R;

  mappar( int i=0 to M/P,
          int j=0 to N/R ) {
    mapseq( int k=0 to T/Q ) {
      matmul( A[P*i:P*(i+1);P][Q*k:Q*(k+1);Q],
              B[Q*k:Q*(k+1);Q][R*j:R*(j+1);R],
              C[P*i:P*(i+1);P][R*j:R*(j+1);R] );
    }
  }
}
```

```
matmul( A[P*i:P*(i+1);P][Q*k:Q*(k+1);Q],
        B[Q*k:Q*(k+1);Q][R*j:R*(j+1);R],
        C[P*i:P*(i+1);P][R*j:R*(j+1);R] );
```

```
task matmul::leaf( in    float A[M][T],
                  in    float B[T][N],
                  inout float C[M][N] )
{
  for (int i=0; i<M; i++)
    for (int j=0; j<N; j++)
      for (int k=0; k<T; k++)
        C[i][j] += A[i][k] * B[k][j];
}
```

Variant call graph

Task hierarchies

```
task matmul::inner( in    float A[M][T],
                   in    float B[T][N],
                   inout float C[M][N] )
```

```
{
  tunable int P, Q, R;

  mappar( int i=0 to M/P,
          int j=0 to N/R ) {
    mapseq( int k=0 to T/Q ) {
```

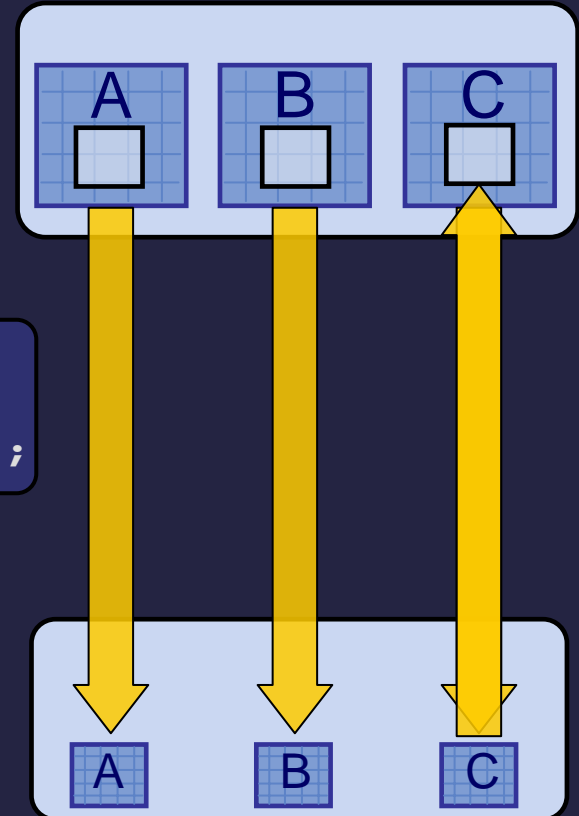

```
      matmul( A[P*i:P*(i+1);P][Q*k:Q*(k+1);Q],
              B[Q*k:Q*(k+1);Q][R*j:R*(j+1);R],
              C[P*i:P*(i+1);P][R*j:R*(j+1);R] );
    }
```

```
  }
}
```

```
task matmul::leaf( in    float A[M][T],
                  in    float B[T][N],
                  inout float C[M][N] )
```

```
{
  for (int i=0; i<M; i++)
    for (int j=0; j<N; j++)
      for (int k=0; k<T; k++)
        C[i][j] += A[i][k] * B[k][j];
}
```

Calling task: `matmul::inner`
Located at level X

Callee task: `matmul::leaf`
Located at level Y

Task hierarchies

```
task matmul::inner( in    float A[M][T],
                   in    float B[T][N],
                   inout float C[M][N] )
{
  tunable int P, Q, R;

  mappar( int i=0 to M/P,
          int j=0 to N/R ) {
    mapseq( int k=0 to T/Q ) {

      matmul( A[P*i:P*(i+1);P][Q*k:Q*(k+1);Q],
              B[Q*k:Q*(k+1);Q][R*j:R*(j+1);R],
              C[P*i:P*(i+1);P][R*j:R*(j+1);R] );

    }
  }
}
```

- Tasks express multiple levels of parallelism

Leaf variants

- Be practical: Can use platform-specific kernels

```
task matmul::leaf(in    float A[M][T],
                 in    float B[T][N],
                 inout float C[M][N])
{
    for (int i=0; i<M; i++)
        for (int j=0; j<N; j++)
            for (int k=0; k<T; k++)
                C[i][j] += A[i][k] * B[k][j];
}
```

```
task matmul::leaf_cblas(in    float A[M][T],
                       in    float B[T][N],
                       inout float C[M][N])
{
    cblas_sgemm(A, M, T, B, T, N, C, M, N);
}
```

Summary: Sequoia tasks

- Single abstraction for
 - Isolation / parallelism
 - Explicit communication / working sets
 - Expressing locality
- Sequoia programs describe hierarchies of tasks
 - Mapped onto memory hierarchy
 - Parameterized for portability

Mapping tasks to machines
